No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 7,

cholecystokinin-5 - dog
NiAlternate names: CCK-5
Clobecies: Canis lupus familiaris (dog)
Cj.Species: Taleoct-1989 #sequence_revision 18-oct-1989 #text_change 18-Aug-2000
Cj.Species: Taleoct-1989 #sequence_revision 18-oct-1989 #text_change 18-Aug-2000
Cj.Species: Taleoct-1892, J.; Reeve Jr., J.R.; Bysselein, V.E.; Ben-Avram, C.; Vigna, S.R.; Walsh, J.H.
Am. J. Physiol. 252, G272-G275, 1987
A.Title: CCK-5: sequence analysis of a small cholecystokinin from canine brain and intest
A.Reference number: A32516
A.Reference number: A32516
A.Residues: J-5 calls
Cj.Comment: This peptide corresponds to the five carboxyl-terminal residues of cholecystoking comment: This peptide corresponds to the five carboxyl-terminal residues of cholecystoking Cj.Superfamily: gastrin
Cj.Superfamily: gastrin
Cj.Superfamily: amidated carboxyl end, neuropeptide
F;5/Modified site: amidated carboxyl end (Phe) #status experimental

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dradykinin-potentiating peptide 7 - island jararaca
bradykinin-potentiating peptide 7 - island jararaca
C,Species: Bothrops insularis (island jararaca)
C,Date: 14-Peb-1992 #sequence_revision 01-Dec-1992 #text_change 05-Aug-1994
C,Accession: G37196
R,Cintra, A.C.O.; Vieira, C.A.; Giglio, J.R.
J. Protein Chem. 9, 221-227, 1990
A,Title: Primary structure and biological activity of bradykinin potentiating peptides
A,Reference number: A37196; MUID:90351557; PMID:2386615
A,Ression: G37196
A,Status: preliminary
A,Molecule type: protein
A,Residues: 1-5 <CIN>
C,Reywords: pyroglutamic acid
F;1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental

"Cardioactive peptides isolated from the brain of a Japanese octopus,
Octopus minor.";
Peptides 21:623-630(2000).
-!- FUNCTION: Cardioactive; has both positive chronotropic and
inotropic effects on the heart. Ocp-4 is a 1000 time less
active than Ocp-3.
-!- SUBCELLUIAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

I. FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ARGIOTENSIN-CONVERTING ENZYME AND ENHANCES THE ACTION OF BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.

Identification and immunocytochemical localization of proctolin in pericardial organs of the shore crab, Carcinus maenas.";
-1- FUNCTION: STIMILATES CARDIAC OUTPUT AND HINDGUT MOTILITY,
MODULATES VISCERAL AND SKELETAL MUSCLE IN MANY ARTHROPODS.
-1- TISSUE SPECIFICITY: FOUND IN THE LATERAL WHITE NEURONS AND IN THE CRAB PERICARDIAL ORGANS.

New humanised anti-CEA monoclonal antibody - having engrafted murine CDRs, used for diagnosis, imaging and therapy of CEA-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New humanised monoclonal antibodies (MAbs) comprising the complementary determining regions (CDRs) of a parental murine class III anti-carcinoembryonic (CBA) MAb engrafted to the framework regions (FRs) of a heterologous antibody which can be derived from any species including human, retain the anti-CBA binding specificity
                                                                                                                                                                                                               Mice were immunised with an extract of human atherosclerotic plaque, then spleen cells were fused with SP2/01-Ag-14 myeloma cells. Hybridomas were screened by ELISA for reactivity with the immunogen and clone 22D3 was isolated. The Z2D3 antibody reacts specifically with atherosclerotic tissue; it recognises a non-protein antigen containing cholesterol (or similar steroid that is a substrate for cholesterol vaidase) and aquaternary ammonium salt (pref. a phosphalidylcholine or related compound that is a substrate for phosphalidylcholine or related compound that is a substrate for phosphalidylcholine or related compound that is a substrate for phosphalipase C). The CDR sequences for the heavy and light chains of Z2D3 were determined; peptides comprising the CDRs are claimed,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monoclonal antibody, humanised, mouse, framework region, FR; CDR; complementary determining region, anti-carcinoembryonic antigen; CEA; diagnosis; imaging; therapy; immune response.
                                      New antigen comprising hydroxy:steroid and quat. ammonium salt and related antibodies, useful e.g. for imaging, ablating or treating atherosclerotic plaque, and detecting plaque specific antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 29; DB 15; Length 5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                             (CDR HI) of the heavy chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also ANY32263). The invention provides altered antibodies, wuch as chimeric or humanised antibodies, which comprise sufficient of the antho acid sequences of C11 light and heavy chain CDRs (see ANY3254-59) to render them capable of binding to the CD23 C type II molecule expressed on haemacopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, clabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowed lisease, allorgic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, colitis, Crohn's disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Atherosclerosis, atherosclerotic plaque, anti-hydroxysteroid antibody, murine monoclonal antibody, heavy chain variable region: CDR1, complementarity determining region; imaging; plaque ablation.

This sequence represents a heavy chain complementarity determining region (CDR) from a tumour antigen specific antibody.

The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour
of the parental murine MAb but are less immunogenic in a human subject than the parental MAb. The humanised antibodies can be used in diagnosis, imaging and therapy of CEA-producing cancers and patients receiving the humanised antibodies and conjugates show decreased therapeutic results, decreased immune responses and decreased immune-mediated adverse effects compared to the parent entibody. This sequence is a murine derived CDR region which corresponds to CDR 1 in the heavy chain of the humanised MAb. See
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tumour antigen; antibody; CDR; complementarity determining region;

The present sequence is given in a specification relating to an isolated nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein v (GPVI), also called TANGO 26s. The GPVI polymucleorides and polypeptides and their modulators, e.g. antisense nucleic acids, ribozymes and antibodies, are useful for preventing, treating and disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. thrombocic occlusion of the coronary artery diseases (e.g. stroke and isorders, coronary artery and cerebral artery diseases (e.g. stroke and isorders), cardiovascular diseases (e.g. atherosclerosis and myocardial infarction), immunological diseases (e.g. platelet disorder) and cardiac isohaemia following angioplasty and metastatic cancers, especially of the colon and liver.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a human or humanised antibody (Ab) which specifically binds to fibroblast activating protein alpha (FAPalpha). The antibodies are useful for preparing a composition for the treatment of cancer, and for imaging tumours associated with activated stromal fibroblasts, such as colorectal cancer, non-small-cell lung cancer, breast cancer, head and neck cancer, non-small-cell lung cancer, cancer, pancreatic cancer and metastatic brain cancer, and diseases associated with the same, such as inflammation and wound healing. The present sequence is a peptide described in the exemplification of the
                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human humanized antibody that specifically binds to fibroblasts activating protein alpha, useful for treating cancer or tumor, and for imaging tumors associated with activated stromal fibroblasts, e.g. lung or breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This invention relates to a molecule that binds MCP-1 (human monocyte chemoattractant protein-1). The molecule has at least one antigen beinding site compilating at least one immunosjobulin (Ig) heavy and/or light chain variable domain (Wh. VI). The antibody of the invention inhibite binding of MCP-1 (and also eotaxin) to specific receptors, so preventing migration of monocytes and T cells. These are human creation with other human CC-type chemokines or MCP-1 from other antibodies with very high affinity for MCP-1, but no significant reaction with other human CC-type chemokines or MCP-1 from other species. The MCP-1 binding molecules, specifically antibodies that cross react with eotaxin, are used to prevent or treat MCP-1 or eotaxin-completed disorders, particularly those that involve migration or activation of monocytes and T cells, e.g. allergies (allergic rhinitis, thypersensitivity responses, allergic context dermatise), inflammatory bowel disease (athma, psoriasis, COPP, inflammatory bowel disease, contensity diseases (athma, psoriasis, COPP, inflammatory bowel disease, costeoarthritis, diopathic thrombocytopaenia) graft rejection, cancers that include leucocyte infiltraction, (rel stenosis, rejection, cancers that include leucocyte infiltraction, the present sequence represents the human anti-(MCP) arteriosclerosis, osteoarthritis, and many other diseases listed in the cancer in sequence hypervariable domain peptide CDRI of the
                                                                                                   New compound that binds human monocyte chemoattractant protein-1, useful e.g. for treating inflammation, comprises immunoglobulin chains with specific hypervariable regions
                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 35; 42pp; English.

It is optionally humanized and in the form F(ab/2, F(ab)', Fab, Fv, scFv or V-min, and is produced in transgenic animals or plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

The invention relates to the use of an antibody and/or chemokine construct that binds a chemokine receptor for preparing a pharmaceutical composition for eliminating cells latently infected with a primate immunodeficiency virus (e.g. human immunodeficiency virus (HIV-1). They are used in gene therapy and as vaccines. The antibody and/or chemokine construct is also used for preparing a pharmaceutical composition for treating, preventing and/or alleviating immunological disorders including autoimmune diseases (e.g. multiple sclerosis, type I diabetes and rheumation, atopic dermatitis, allergic diseases, skin diseases (e.g. skin inflammation, atopic dermatitis and psoriasis), inflammatory diseases out as inflammatory joint diseases (chronic arthritis), inflammatory creal diseases and sinflammatory bowel diseases and graft versus host and transplant rejections. The present sequence is murine Mc-1 antibody heavy, chain variable domain (VH) complementarity determining region 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                               Complementarity determining regions (CDRs) CDR1H, CDR2H and CDR3H (AAR85496-98) and CDR1L, CDR2L and CDR3L (AAR85502-04) are components of the heavy chain variable region and light chain variable region, respectively, of single chain antibody scFv(FWP51) (AAR85495). The CDRs are derived from mouse monoclonal antibody FWP51 (ECACC 90112118) directed to the human growth factor receptor HBR2. The scFv is used as the tumour antigen binding domain of a bifunctional protein that is expressed in cytotoxic T-lymphocytes (CTLs), allowing

This sequence represents the complementarity determining region-1 (CDR-1) of the rWI2 heavy Chain. This sequence is used in an antibody of the invention. The antibody of the invention is a chimeric or humanised anti-idiotype antibody of the invention is a chimeric or humanised anti-idiotype antibodies (cAb and hAb, respectively) or a fragment which sepcifically binds to the idiotype region of an anti-carcinoembryonic antigen (CBA), where: (i) cab comprises the rWI2 light (I) and heavy (H) chain variable regions, or silent mutations, and (ii) hAb comprises rWI2 complementarity determining regions (CBR) and humanised framework (FR) regions. The hAb is used as a vaccine to stimulate an immune response in a patient against cancers expressing CBA. The hAb, can be used to clear non-targeted antibody in a method of diagnosis or treatment of a patient where a CBA antibody is used as a (pre-)targeting or therapy agent. The cAb is used to detect the presence of an antibody that specifically binds to CBA in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Monoclonal antibody; hypervariable domain; heavy chain; CDR1; neutralise; Clostridium difficile; epitope; ligand domain; immunotherapy; disease; translocation domain; catalytic domain; humanised antibody; enterotoxin; toxin A; toxin B; pseudomembranous colitis.

This invention relates to sialoadhesin factor-1 (SAF-1) monoclonal antibodies 13G3 and 11G4. A neutrophil-priming dose of SAF-1 agonist antibody or a pharmaceutical composition comprising the antibody is useful for treating or preventing an infectious disease state such as bacterial infection, viral infections, sepsis, antibiotic resistant bacterial infection, viral infections and those involving intracellular pathogens and parasites such as Listeria monocytogenes, Salmonella and lesishmania in a mammal. Nucleic acid sequences encoding the variable light chain and heavy chain peptide sequences are useful for mutagenic introduction of specific changes within the nucleic acid sequences encoding the (complementarity determining regions) CDRs or framework and for incorporation of the resulting modified or fusion nucleic acid sequence into a plasmid for expression. The CDR-encoding regions comprising silent mutations are used in construction of humanized
This invention describes a novel monoclonal antibody that is directed against. a Clostridium difficile toxin and recognises and neutralises an epitope in the ligand domain, translocation domain or catalytic domain of the toxin. Humanised antibodies are desribed which are expressed in plants and can be used for immunotherapy of diseases caused by Clostridium difficile enterotoxin (toxin A) or cytotoxin (toxin B), especially pseudomembranous colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New sialoadhesin factor-1 agonist antibody having the characteristic of monoclonal antibody 13G3 or 11G4 for treating osteomyelitis, deep seated wound infections and antibiotic resistant bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sialoadhesin factor-1; SAF-1; anti-SAF-1 wonoclonal antibody; 13G3; 11G4; osteomyelitis; wound infection; sepsis; Listeria monocytogene; Salmonella; Leishmania; heavy chain variable region; mouse; complementarity determing region; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anti-SAF-1 antibody 13G3 H chain V region CDR peptide SEQ ID 3.
                                                                                                                                                                                                                                               ö

The method involves administering an inhibitor of an interaction between a pathogenic immunoglobulin, and an ischemic-specific antigen or a component of the complement pathway. The method is useful for treating or preventing immunoglobulin-mediated reperfusion or ischemic injury, in particular, injury that results following a naturally occurring episode, a surgical procedure (e.g. angioplasty, stenting procedure, atherectomy or bypass surgery), or in an injury that occurs in a cardiovascular tissue. The method is also useful for treating or preventing, in a subject, tissue damage following reperfusion caused by a pathogenic immunoglobulin, e.g. pathogenic igms. The present sequence represents the complementarity determining region (CDRI) of a heavy chain variable region of 2285 IgM, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

This antibody contains in its heavy chain 3 complemetarity determining regions CDR1 (AAR74929-R74931), CDR2 (AAR74932-R794935) and CDR3 (AAR74936-R74939), this is also true of the light chain which has its own CDR1 (AAR74944-R74946 and AAR85774), CDR2 (AAR74947-R74949) and CDR3 (AAR74950-R74954). The antibody and DNA encoding it are useful in pharmacological, medical and blochemical fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                         H-CDR-1 of anti-idiotype antibody against human anticancer antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel anti-idiotype antibody against an human anticancer monoclonal antibody - and DNA sequences encoding the antibody, useful in pharmacology, medicine and biochemical fields.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SEQUENCE 1, Application US/09155106

PUBLICATION NO. US20030054003A1

GENERAL INFORMATION:

TITLE OF INVENTION: HUMANIZATION OF AN ANTI-CARCINOEMBRYONIC

TITLE OF INVENTION: ANTIGEN ANTI-IDIOTYPE ANTIBODY AND USE AS A TUMOR VACCINE

TITLE OF INVENTION: AND FOR TARGETING APPLICATIONS

NUMBER OF SEQUENCES: 45

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OFFRATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/09/155,106

FILING DATE: 19-MAR-1997

Sequence 1, Application US/09770002

Patent No. US20020110558A1

GENERAL INFORMATION:

APPLICANT: Peter Lloyd Amlot

APPLICANT: Max H. Schreier

APPLICANT: Max H. Schreier

TITLE OF INVENTION: Use of CD25 binding molecules in the

TITLE OF INVENTION: treatment of rheumatoid arthritis or skin diseases.

CURRENT APPLICATION NUMBER: US/09/770,002

CURRENT APPLICATION NUMBER: US/09/770,002

PRIOR APPLICATION NUMBER: PCT/EP99/05316

MANDER OF THE TENDER FILING DATE: 1999-07-26

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5al1248

GENERAL INFORMATION:
TITLE OF INVENTION: ATHEROSCLEROTIC PLAQUE SPECIFIC ANTIGENS,
TITLE OF INVENTION: ANTIBODIES THERETO, AND USES THEREOF
NUMBER OF SEQUENCES: 88

CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York
STATE: New York
COUNTRY, U.S.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 23, Application US/08318157B
Patent No. 5874540
GENERAL INFORMATION:
APPLICANT: HANSEN, Hans J.
TITLE OF INVENTION: CDR-GRAFTED TYPE III ANTI-CEA HUMANIZED
TITLE OF INVENTION: MOUSE MONOCLONAL ANTIBODIES
NUMBER OF SEQUENCES: 58
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    81.8%; Score 27; DB 2; Length 5; 100.0%; Pred. US-08-118-970B-3

Sequence 3, Application US/08318970B

Sequence 3. Application US/08318970B

Patent No. 5589573

GENERAL INFORMATION:

APPLICANT: Hideaki HAGIWARA, et al.

TITLE OF INVENTION: AMINO ACID SEQUENCES OF ANTI-IDIOTYPIC

TITLE OF INVENTION: ANTIBODIES AGAINST ANTI-CANCER HUMAN WONCCLONAL ANTIBODY

TITLE OF INVENTION: AND DNA BASE SEQUENCES ENCODING THOSE SEQUENCES

MUMBER OF SEQUENCES: 48

CORRESPONDENCE ADDRESS:

Sequence 7, Application US/08479089A

Patent No. 6383487

GENERAL INPORMATION:
APPLICANT: Andot, Peter L.
APPLICANT: Andot, Gunther
APPLICANT: Cammisuli, Salvatore
TITLE OF INVENTION: CD25 Binding Molecules
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: No. 6383487artis Corporation
STREET: 564 Morris Avenue
CITY: Summit
STATE: NJ
COUNTRY: USA
ZIP: 07901-1027
COMPUTER READABLE FORM:
MEDIUM TYPE: BIPPY disk
COMPUTER: IBM PC Compatible
OPERATION SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T-cell receptor beta chain (BTB98) - bovine (fragment)
Cispecies: Bos primigenius taurus (cattle)
Cispecies: Bos primigenius taurus (cattle)
Cispecies: Bos primigenius taurus (cattle)
Ciscession: PQ0072
Ritanaka, A.; Ishiguro, N.; Shinagawa, M.
Bibanaka, A.; Ishiguro, N.; Shinagawa, M.
A; Description: Sequence analysis of bovine T-cell receptor beta chain genes.
A; Accession: PQ0072
A; Molecule type: mRNA
A; Residues: 1-18 < TAN>
A; Experimental source: T cell
C; Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
